# AlliedWare Plus

Key features

Sophisticated application and web control

- ▶ Deep Packet Inspection (DPI) firewall
- ▶ Application control
- ▶ Web control
- ▶ URL filtering

Comprehensive threat protection

- ▶ Advanced IPS (Intrusion Protection System)
- ▶ IP reputation services

Security performance (UTM offload)

Advanced connectivity

- ▶ Secure remote VPN access
- ▶ Site-to-site VPN connectivity
- ▶ Advanced routing capabilities
- ▶ Resilient WAN connectivity
- ▶ USB modem (3G/4G) connectivity
- ▶ SD-WAN

Powerful centralized management

- ▶ Manage and monitor the firewall
- ▶ Autonomous Management Framework Plus (AMF Plus)
- ▶ Autonomous Wave Control (AWC)
- ▶ Vista Manager mini
- ▶ Flexible licensing options

AlliedTelesis.com

AR3050S/AR4050S
UTM Firewall Overview

Allied Telesis Unified Threat Management (UTM) Firewalls provide advanced threat protection in a fully integrated security solution for today's networks.

Allied Telesis UTM Firewalls have an integrated architecture built on AlliedWare Plus, our advanced operating system. As well as Allied Telesis' industry leading key features, our UTM Firewalls utilize best of breed security providers, for up-to-the-minute protection from all known threats.

A fully integrated solution

Today's online experience revolves around applications, content, and user interaction. As network access has advanced, cyber threats have become more sophisticated. Targeted and tailored attacks are increasingly beating established defenses. To meet these challenges, a new breed of products have consolidated threat management capabilities into a single device to increase the security of business communications. Multiple threat detection and protection capabilities are now integrated within a purpose-built solution that provides protection for all network traffic.

Complete network security

Comprehensive application and content identification provides visibility into network activity, to allow intelligent control of network traffic. This visibility and control, partnered with advanced threat protection, together provide comprehensive online security for Enterprise businesses. With Allied Telesis advanced routing functionality, powerful VPN capabilities for remote access, and a cohesive single-pane-of-glass management console, our UTM Firewalls are a complete network security solution. The AR4050S is also ICSA corporate firewall certified.

Innovative networking

Allied Telesis UTM firewalls incorporate a number of innovative features to simplify network operation. Integrated network management, as well as visual wireless network performance monitoring, ease administration. Secure Software Defined WAN maximizes performance of inter-branch traffic, secures critical and sensitive data, and reduces cost and complexity.

NETWORK SMARTER

Key features

Sophisticated application and web control

The Internet has evolved immensely. Whereas once it simply provided pages to be browsed, it now offers applications that enable people to interact, with Web 2.0 services such as collaborative document creation, social networking, video conferencing, cloud-based storage, banking and much more.

Organizations must be able to control the applications that their people use, and how they use them, as well as managing website traffic. Allied Telesis UTM Firewalls provide the visibility and control that are necessary to safely navigate the increase in online applications and web traffic that are used for effective business today.
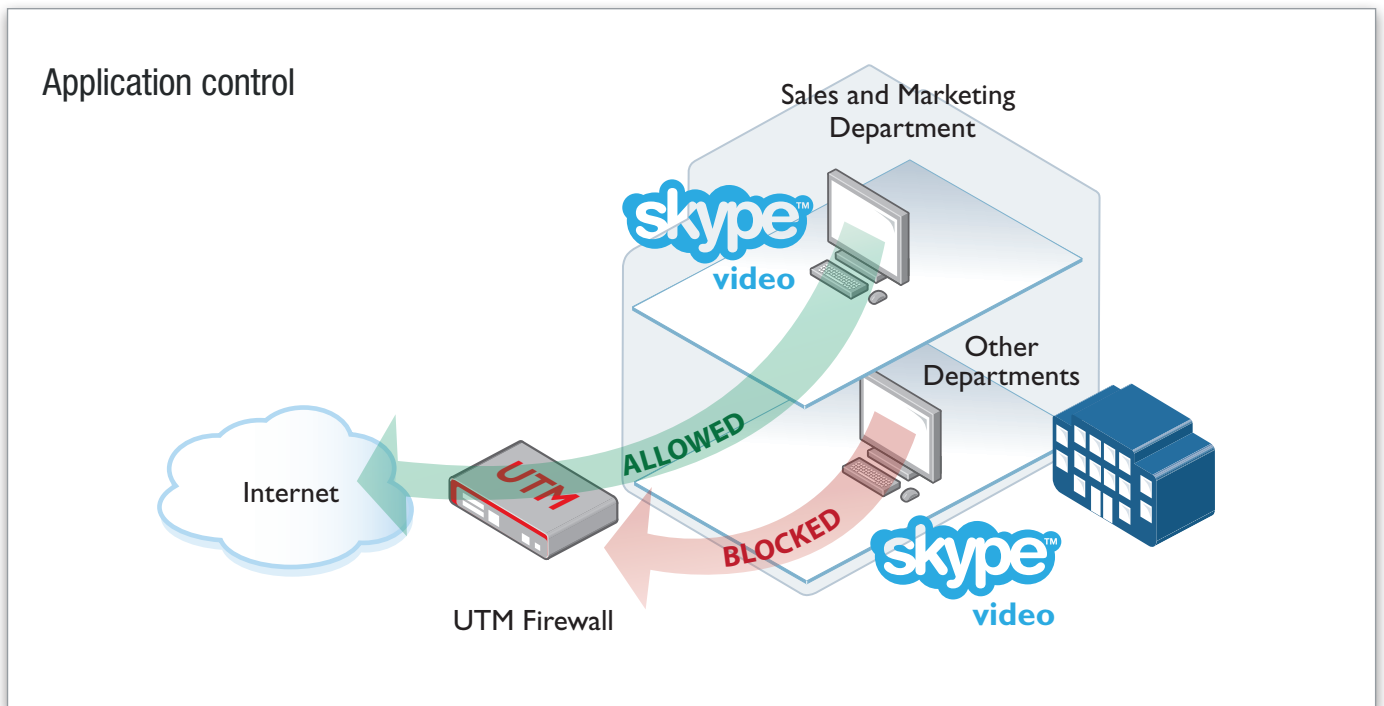

Deep Packet Inspection (DPI) firewall

The AlliedWare Plus firewall is a Deep Packet Inspection (DPI) engine that provides real-time, Layer 7 classification of network traffic. It inspects every packet that passes through, and accurately identifies in use applications, for example social networking, instant messaging, file sharing, and streaming, whilst still maximizing throughput and reducing latency.

The AlliedWare Plus DPI firewall utilizes either the free built-in application list, or a more comprehensive subscription-based list to identify individual applications. Highly accurate real-time detection, and up-to-the-minute classification additions and updates, ensure precise identification of network traffic.

The AlliedWare Plus DPI firewall also supports filtering based on hierarchical entities, such as zones (logical groupings of networks), networks and hosts, to empower organizations to accurately apply and manage security policies at company, department or individual level.

Application control

The increased network visibility provided by the application-aware firewall allows fine-grained application, content and user control. Reliable identification of the individual applications means that rules can be established to govern not only which are allowed, but under what circumstances, and by whom. This allows Enterprises to differentiate business-critical from non-critical applications, and to enforce security and acceptable use policies in ways that make sense for the business. For example, Skype chat may be allowed company wide, while Skype video calls can only be made by sales and marketing.

UTM Firewall

Web control

Web control provides Enterprises with an easy means to monitor and control their employees' web traffic for productivity, legal and security purposes. An active rating system provides comprehensive and dynamic URL coverage, accurately assigning websites or pages into categories, and allowing or blocking website access in real-time.

Once a particular URL has been categorized, the result is cached in the firewall so that any subsequent web requests with the same URL can be immediately processed according to the policy in place.

Allied Telesis web control boosts user productivity, ensures compliance, and saves bandwidth, while preventing web-based threats from infecting your business.

URL filtering

Alongside web control, URL filtering provides another option for controlling web traffic. HTTP or HTTPS access to particular websites can be allowed (whitelist) or blocked (blacklist) with user-defined lists, providing businesses with simple website access management.

URL filtering offers high-performance website control across all users, and protection against known malicious websites.

Comprehensive threat protection

The fundamental shift to sophisticated application usage has provided an online experience that businesses can greatly profit from. There is now increased efficiency, improved collaboration, along with new ways to manage customer interaction. However, this has also opened the door for greater security concerns. Business data is potentially vulnerable, and the rapid development of new services has introduced new types of cyber threats.

An organization needs a security solution that can recognize and mitigate the ever-increasing range of threats. Allied Telesis UTM Firewalls provide comprehensive threat protection in a fully integrated security platform, using specialized multi-core CPUs optimized for single-pass low-latency performance. They utilize security engines, and threat signature databases from the industry's leading vendors, with regular updates to ensure up-to-the-minute protection against cyber attacks.
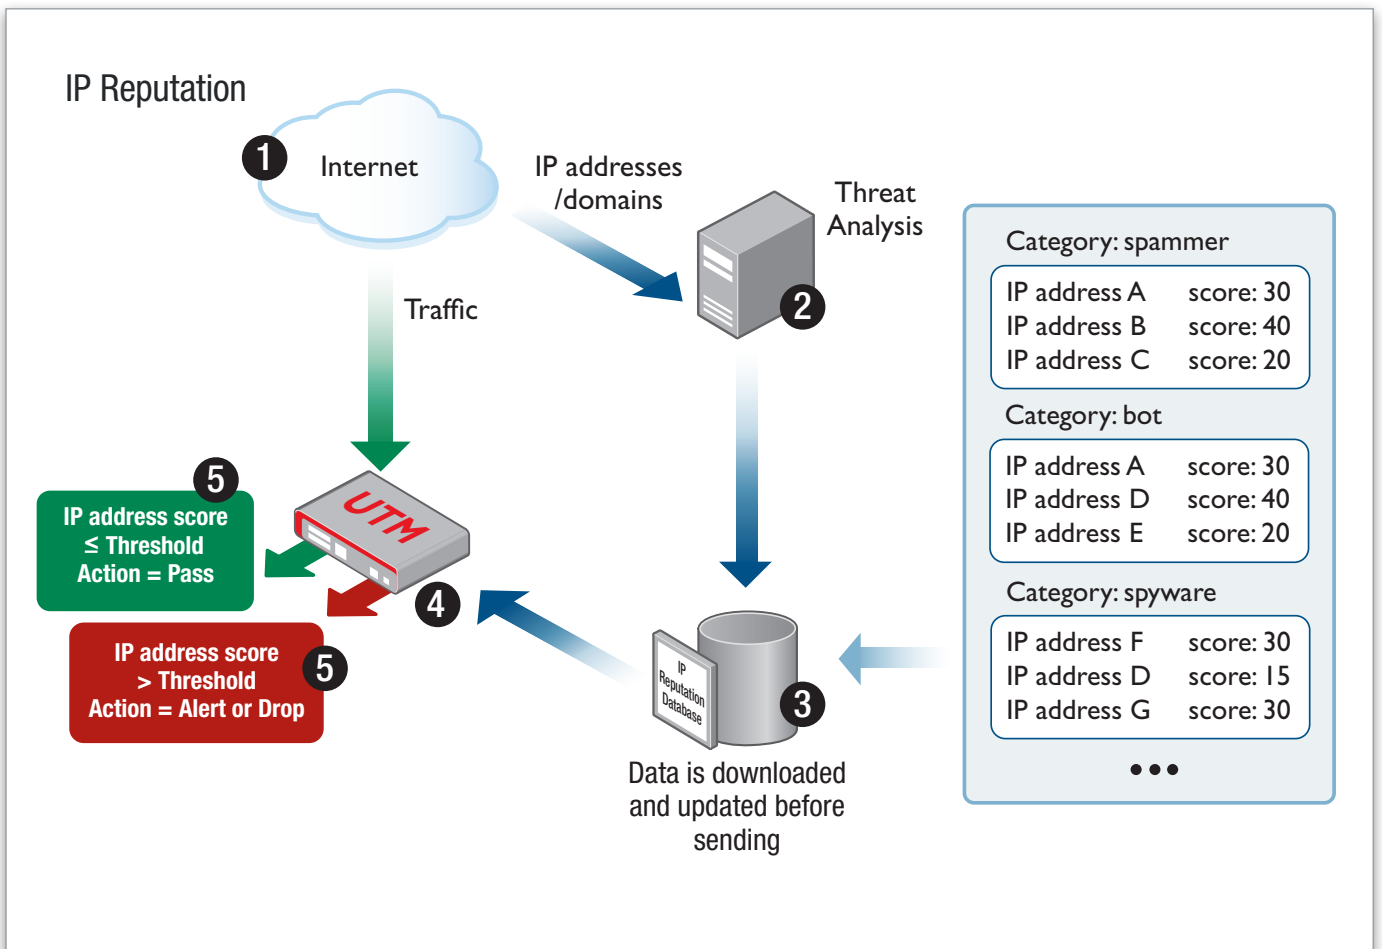

Advanced IPS (Intrusion Protection System)

Advanced IPS detects and blocks threats. Updated daily, it covers malware delivery, command and control, attack spread, in-the-wild exploits and vulnerabilities, and credential phishing. It also detects and blocks distributed denial-of-service attacks (DDoS), protocol and application anomalies, exploit kits and supervisory control and data acquisition (SCADA) attacks - ensuring a secure business environment.

IP reputation

IP reputation improves the success of Intrusion Prevention by reducing false positives. It provides an extra variable to the prevention decision, which allows rules to be crafted to drop packets only if the reputation exceeds a chosen threshold.

IP Reputation uses regularly updated and comprehensive reputation lists which identify and categorize IP addresses that are sources of spam, viruses and other malicious activity. With real-time threat analysis, and regular updates to reputation lists, IP Reputation delivers accurate and robust scoring, ensuring strong local policies can be carried out with surgical precision.

UTM offload

UTM Offload (available on the AR4050S only) improves WAN throughput when using multiple security features together, or when higher performance is required.

It enables some security and threat protection features (IPS, IP-Reputation, and URL Filtering) to be offloaded to a secondary physical or virtual machine that is automatically managed by the AR4050S. UTM Offload can up to double WAN connection throughput when using these features for real-time threat protection, or in conjunction with Firewall, NAT, and Application Control to manage business application use.

Note: it is recommended not to use UTM Offload when using the proxy-based Web-Control feature.

Advanced connectivity

Allied Telesis UTM Firewalls are a powerful and fully integrated solution that inspect and protect business data to ensure a secure online experience. Furthermore, they also provide comprehensive user connectivity through remote Virtual Private Network (VPN) access, advanced routing capabilities for Internet gateway applications, and powerful resiliency and WAN optimization features.

This broad and comprehensive feature set makes our firewalls a complete integrated solution for secure Internet connectivity.

Secure remote VPN access

Allied Telesis UTM Firewalls provide secure remote access, so employees can utilize all their business resources whether they are physically inside or outside their company premises. Staff members have the ability to work securely from remote locations.

An SSL VPN creates a secure tunnel over the untrusted and insecure Internet, by encrypting traffic. Users simply utilize the OpenVPN client on their computer, tablet or other mobile device. SSL VPNs are compatible with the security policies of almost all network installations, making them an ideal option for travelling staff that may need to connect to the corporate network from a variety of public-space networks.

Site-to-site VPN connectivity

An IPsec site-to-site VPN can securely connect one or more branch offices to a central office, which saves the cost of expensive leased lines, and provides workers company-wide with the same access to the corporate network.
Advanced routing capabilities

Allied Telesis integrated security platforms include advanced routing and switching capabilities. With support for dynamic routing protocols, and business WAN connectivity, the firewalls provide a single-box platform for connecting and protecting modern Enterprise data communications. Comprehensive routing capability includes full IPv4/IPv6 unicast and multicast support, VRF-Lite, traffic shaping, email proxy, application layer gateways and more.

By concentrating all the security and connectivity operations into a single device, modern businesses gain all of the performance, support, and value of a fully integrated solution from a single vendor .

Resilient WAN connectivity

The UTM Firewalls have a high-availability bypass port, which allows device redundancy with only a single WAN link, reducing ongoing ISP fees. If the Master firewall loses power, traffic is automatically forwarded to the backup device, keeping Enterprises online and connected to their business partners and customers.

USB modem (3G/4G) connectivity

The UTM Firewalls have a USB slot which supports using a flash drive for data transfer, as well as using a USB cellular modem for 3G/4G connectivity. This enables online connectivity via a mobile network where required, and can also provide a WAN backup solution, with a cellular connection automatically made if the primary WAN interface goes down.

SD-WAN

Software Defined Wan (SD-WAN)

SD-WAN provides businesses with improved inter-branch network performance and reduced cost, by automatically optimizing application traffic over multiple WAN links between offices. SD-WAN uses the UTM firewalls (or our VPN routers) for branch connectivity, to ensure secure transport of critical and sensitive data.

SD-WAN can be fully configured on the firewalls CLI. However, for central management and monitoring of the entire WAN network, the SD-WAN orchestrator integrated into Vista Manager EX (our network management and monitoring platform) provides the ability to set acceptable performance metrics for any application, and load-balance all inter-branch traffic to meet requirements. By monitoring VPN link quality, time-sensitive or critical traffic is automatically switched over to the optimal link as required. Visual monitoring enables easy management of the WAN, with the ability to drill down to specific links or applications to assess live and historical operation.
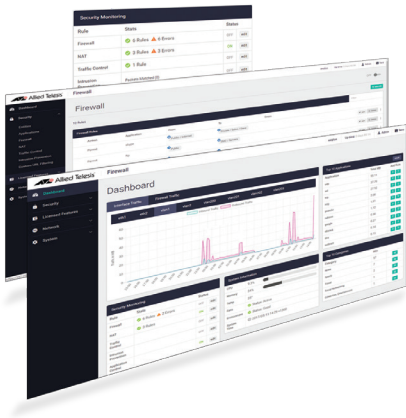

Powerful centralized management

Allied Telesis UTM Firewalls provide a full suite of security and connectivity features, that work cohesively to protect business networks and users. As well as visual dashboard monitoring and response, our firewalls also support fully automated configuration, backup and recovery, to ensure Enterprise businesses are never without connection to their online resources and applications. Built-in management capabilities enable centralized network administration, as well as full visibility of a wireless LAN.

Manage and monitor the firewall

The firewalls provide an industry standard Command Line Interface (CLI), and a Graphical User Interface (GUI).

The Device GUI provides a dashboard for monitoring, showing traffic throughput, security status, and application use at a glance. Configuration of security zones, networks and hosts, and rules to limit and manage traffic, as well as management of advanced threat protection and routing features, provides a consistent approach to policy management.

Autonomous Management Framework Plus (AMF Plus)

AMF Plus is a sophisticated suite of management tools that provide a simplified approach to network management. Common tasks are automated and every-day running of the network made extremely simple. Powerful features like centralized management, auto-backup, auto-upgrade, auto-provisioning and auto-recovery, enable plug-and-play networking and zero-touch management.

Allied Telesis UTM Firewalls support AMF Plus, so they can integrate with our switching products to form a network able to be managed as a single virtual device. A full suite of automated tools ensure that the firewall configuration is backed up, and able to be recovered with no user intervention, maximizing availability of online services.

The AR4050S can act as an AMF Plus master, backing up the network and supporting the full suite of powerful features listed above.

Autonomous Wave Control (AWC)

The firewalls feature Allied Telesis Autonomous Wave Control (AWC), which is an intelligent, easy-to-use Wireless LAN controller that automatically maintains optimal wireless coverage. A number of our wireless access points support hybrid operation, where traditional multi-channel (for the best throughput) and single-channel (called Channel Blanket, which provides seamless roaming) can operate together.

Vista Manager mini

As well as providing graphical management and monitoring of the firewall, the Device GUI incorporates Vista Manager mini for easy visual management and

monitoring of an AWC wireless network. Auto-setup and centralized management make wireless network administration simple, while network, floor, and heat-maps provide visual monitoring of wireless coverage and performance.

Flexible licensing options

The Allied Telesis integrated security platforms utilize best-of-breed security providers for the ultimate in up-to-the-minute protection from all known threats. Flexible licensing options make it easy to choose the right combination of firewall and Intrusion detection/protection security features, as well as AMF Plus and AWC management features, to best meet your business needs.

Allied Telesis UTM Firewall products

The Allied Telesis AR3050S and AR4050S combine firewall and threat protection with routing and switching in a single, high-performance integrated security platform. An ideal choice for high-speed Internet gateway applications, the Allied Telesis integrated security platforms meet the needs of modern Enterprise networks. The AR4050S is also ICSA corporate firewall certified.

[2] From AW+ version 5.5.2-2 onwards, AMF Plus licenses provide all standard AMF network management and automation features. They also enable the AMF Plus intent-based networking features menu in Vista Manager EX (from version 3.10.1 onwards)

[3] Purchase one license per 5 nodes (up to 20 nodes maximum)

[4] 5 APs can be managed for free. Purchase one license per 5 additional APs (up to 20 APs maximum)

[5] Channel Blanket and Smart Connect are not available as free services. Both an AWC-CB license and an AWC license are required for Channel Blanket and/or Smart Connect to operate. (Channel Blanket is supported on TQ6602, TQ5403, and TQ5403e access points. Smart Connect is supported on TQ5403, and TQ5403e access points)

[6] To use AMF-Sec in conjunction with either the Advanced Firewall (NGFW) or Advanced Threat Protection (ATP) licenses, you must have AMF-Sec mini version 2.2.1 or newer
